1and1 virtual host, where the main repo and this this whole website are hosted, detects "virus" in the emacspeak packages in extra/ and makes them unreadable. i tried to figure out what exactly they "detect" there, they can't tell. the hashes of these archives match the ones hosted upstream, and we have no reason to think this is anything more than a false positive at the moment. none of our mirrors are thought to be affected, and the official rsync mirror is known to work fine.

suggestions for a fix are welcome
